A generalization of Beck's method for Inverse Heat Conduction Problems

H.-J. Reinhardt[*] and Dinh Nho Hào[†]

Abstract

A finite dimensional variational approach for Inverse Heat Conduction problems is studied. By means of the gradients and the Hessian of the minimizing functional, the unknown heat flux in form of a step function is characterized as the solution of a linear system of equations. In special cases, one obtains the well-known Beck method and a generalization thereof. The latter allows the determination of an optimal number of future times.

Keywords:

Inverse Heat Conduction problems, variational approach, finite dimensional approximation, Beck's methods
